Requirements and recommendations detailed in the Siplast catalog and Siplast long form specifications shall apply in addition to the following recommendations and specifications.

**APPLICATION**

1. Lay one ply of Parabase FS dry over the entire area to be roofed. Lap each sheet 3 inches over the underlying sheet and lap ends 6 inches. Using approved fasteners, nail each sheet every 9 inches through the laps and stagger nail the remainder of the sheet in two rows on nominal 12 inch centers with fasteners in each row on 12 inch centers.

   *The fastening pattern shown in this specification is based on Siplast standard nailing requirements. Contact Siplast for recommended fastening patterns to meet specific testing or code approvals.*

2. Beginning at the low point of the roof, fully mop one ply of Irex 40 to the Parabase FS surface using PA-100 Asphalt, lapping sides and ends a minimum of 3 inches. Offset end laps a minimum of 3 feet.

3. Beginning again at the low point of the roof, fully torch one ply of Veral Aluminum to the Irex 40 surface, lapping sides and ends a minimum of 3 inches. Offset end laps a minimum of 3 feet. Stagger laps between plies.

**Slopes over 2½” per foot:** Run plies parallel to the slope of the roof. Both the Irex and Veral must be backnailed on slopes in excess of 3 ½” per foot.

**NOTES:** Prime foil surfaces to be lapped by adjoining sheets. Venting provisions must be incorporated into lightweight insulating concrete designs.

**Caution:** Siplast recommends that all practices pertaining to NRCA CERTA guidelines be followed when torching methods are employed. This includes performing a fire watch following any torch applications. Always have approved fire-extinguishing equipment nearby.
